                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is an analogue of mature hCG beta subunit having residue 89 replaced by a methonine residue. This introduces an additional cleavage site for CWBF, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "normal" disulphide pettern of examining protein folding.
                                                                               Glycoprotein hormone; human chorionic gonadotropin; disulphide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glyco-protein hormone analogues - for inducing fertility as fimuno-costration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glycoprotein hormone; human chorionic gonadotropin; disulphide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides movel vaccine compositions which comprise the beta-subunit of human chorionic gondotropin (betahcofin combination with chicosan-based adjuvants. The vaccines are used to induce infertility especially transient infertility, in female mammals. The compositions are also used for antibody production. The vaccines comprise a well-tonerated chicosan-based adjuvant which induces the production of anti-chorionic gonadotropin antibodies, without inducing the side effects (e.g. hypersensitivity, erythma, etc.) associated with other adjuvants. The present sequence represents a betahof fragment individuals. The present sequence represents a betahof fragment fused to an alpha-mating factor leader sequence at the Neterminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human beta-subunit chorionic gonadotropin vaccines used to interrupt fertility in mammals by the immunological inactivation of the pregnancy hormone chorionic gonadotropin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            63 VRFSSIRLGGCRGVNPVSSVAALSCQCALCRRSTTDCGGFROHPLTCDDPREQDSSSS 122

the invention relates to the production of analogues of a heterodimeric subunit giyosoprotain hormone (GH9) a.9. human individue gonadotrophin (hCG), human inteinising hormone (HH9), human follicle stimulating hormone (HH9), human inteinishing hormone (HH9), human follicle stimulating hormone (HH9), human inteinishing hormone (HH9), and inteinishing more decision of the contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the containing at least a portion of the chaptored stability, the analogue retaining at least a portion of the chaptored stability. The improved analogues are designed specifically to confided GH9. The improved analogues are designed specifically to compete pretarbation of the 3-dimensional structure of the hormon, thereby creating greater likelihood that the dimer will be formed dimer vill have affinity for the native receptors and have and the blongistic activity on them. The changes stabilise the GH9s and prolong as for the native GH9s and prolong as for the native GH9s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Analogue; heterodimeric; glycoprotein hormone; hCG; hLB; hFSH; hTSH; human chorionic gonadorropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human fyvoid stimulating hormone; human thyroid stimulating hormone; stablility; primer; amplification; PCR; mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is an analogue of mature hCG beta subunit having residue 37 replaced by a histidina residue. This introduces an additional cleavage site for CNBr, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "ormal" disulphide pattern of analogues, and for seamining protein folding.
                                                                                                                                                                                                                                                                                                                                                New qlyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Glycoprotein hormone analogue hCG4beta-V44C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ISTF ) ARS APPLIED RES SYSTEMS HOLDING NV.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GRH) e.g. human chiritonic gonadetropin (hCG), human luteinising hormone (HLH), human follicle stimulating conformation of hormone (hESH), human thyroid atmusting hormone (hTSH), and functional muteting, which are modified to contain an intersubunit dissiphide bond, between an alpha-subunit cysteine, for the purposed stablity, the analogue retaining at least a portion of the improved stablity, the naniogue retaining at least a portion of the corresponding native GPH receptor. This sequence represents a mutated hOC beta subunit used for the generation of the condition of the subulity of the orter analogue are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, therefore dimer will have affinity for the native receptors and have adout the formed dimer will have affinity for the native receptors and have the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTCCAGYCPTMTRVLQGVLPALPQVVCNTR 80

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                      the invention relates to the production of analogues of a heterodimeric subunit giyosoprotein hormone (GPH) a.9. Awam chorionic gonadortropin cabbunit giyosoprotein hormone (GPH), haman internising hormone (HPH), haman fullicle stimulating hormone (HPH), haman internising hormone (HPH), haman fullicle stimulating content of the color of the content an intersubunit disamphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the content an intersubunit disamphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the content of the analogue retaining at least a portion of the bloometivity for the corresponding native GPH receptor. This sequence corresponding an autored MGG-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to the reduce perturbation of the 3-dimensional structure of the hormone. Teadure perturbation of the 3-dimensional structure of the hormone. Condition of the subunit used that the dimer will be formed in vivo and the formed dimer vill have affinity for the native receptors and have uses as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chortonic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

vertebrate; polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New alpha, beta-hetero:dimeric polypeptide derivs. - which bind to tutefinising and follicle stimulating hormone receptors, useful for controlling the ratio of FSH to LH activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is an analogue of mature hCG beta subunit having residues 12 and 27 replaced by methonine residues. This introduces additional cleavage sites for CNBr, useful for decembing the dissiphide bonds. This can be used to show that mutageness has not a leered the 'normal' dissiphide pattern of managemes, and for examining protein folding.
                                                                                                                                                                                                                                         New glyco-protein hormone analogues - for inducing fertility a
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ouery Watch 98.31; Score 764; DB 12; Length 145; Best Local Similarity 98.64; Pred. ```
The invention relates to the production of analogues of a heterodimeric subunit giyosototein hormone (GPH) a.9. human chorionic gonadotropin (bCC), human intentials pormone (HMH), human chorionic gonadotropin (c (bCG), human intentials pormone (HMH), human follicle stimulating bormone (HMH), human follicle stimulating companies of the color of the contain an intersubunit disupplide bond, between an alpha-subunit cysteine and a betware subunit cysteine, for c improved stability, the analogue retaining at least a portion of the chapter stability to the corresponding native GPH receptor. This sequence conceptuals a matated hord-betware subunit cysteine of the conceptual and the conceptual analogue sare designed specifically to compare the conceptual analogue are designed specifically to compare the conceptual and the formed dimer vill have affinity for the native receptors and have considered analogues stabilise the open conceptual activity on them. The changes stabilise the GPHs and prolong the bloogical activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Analogue; hèterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

         This protein sequence represents the beta-subunit of human chorionic goadcorpoin (NGS) which can be used in a novel method for detecting conductive cancers and associated tumours. NGC is a dimeric giveductive cancers and associated tumours. NGC is a dimeric giveductive tumours in both men and women. The hGC beta-subunit can reproductive tumours in both men and women. The hGC beta-subunit can can aprilnie specific metalloprocease capable of cleaving the hGC beta subunit at Arg44 or Gly47, but is partially inhibited by phenanthroline or leupeptin. Over 90 per cent of cancer patients show elevated levels of GRNE are useful in the detection and prognosis of cervical, conformation of GRNE are useful in the detection and prognosis of cervical, oversul in the detection and prognosis of cervical, conformation of GNNE are useful in the detection and prognosis of cervical, oversulantly and prognosis of cervical, conformation of GNNE are useful in the detection and prognosis of cervical, conformation of differential diagnosis of benign versus malignant cancers and can also be differential diagnosis of benign versus malignant cancers and can also be used to follow therapy for the treatment of known reproductive cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human experionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human ityroid stimulating hormone; stability; primer; amplification; PCR; mutation.

```
the invention relates to the production of analogues of a heterodimeric subunit giyosoprotein hormone (GFR) = 9. human chorionic gondedtropin (bCG), human intendising hormone (HER), human follicle stimulating hormone (HER), human follicle stimulating hormone (HER), human follicle stimulating connections of the contending the stimulating hormone (HER), and functional muterins, which are modified to contend an intersubunit disupplie bond, between an alpha-subunit cysteine and a beta subunit of setting bond, between an alpha-subunit cysteine and a beta subunit cysteine, for chaptored stability, the analogue retaining at least a portion of the hormonial controlled GFRs. The improved analogues are designed specifically to contend presents a material MCG-beta subunit used for the generation of the contended analogues are designed specifically to the creduce perturbation of the 3-dimensional structure of the hormone and the formed dimer will have affinity for the native ceptors and have as for the native GFRs and prolong the hologolan activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotrophi; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                 The invention relates to the production of analogues of a heterodimeric subunit giycoprotein hormone (GPHS). Howan intentials hormone (PHS), haman intentials hormone (PHS), haman intentials hormone (PHS), haman intentials hormone (HHS), haman follicle stimulating hormone (HHS), haman intentials had functional contents, which are madified to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine for contain an intersubunit disuphide bond, contains the proved stability, the analogue retaining at least a portion of the blackord stability, the analogue retaining at least a portion of the content and the copy of the corresponding native GPH receptor. This sequence contains a matared McG-beta subunit used for the generation of the content and provided analogues are designed specifically to the creduce perturbation of the 3-dimensional structure of the hormon of the content of the dimer will be formed in vivo and the formed dimer will have affinity for the native ecceptors and have seen to all the content of the structure of the stability of the GPHS and prolong the Allongors the Allongors and have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hPSH; hTSH; human chorionic gonadorropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification, ACG; mutation.

The sequence represents the amino acid sequence of gonadotropin analogue beta subunit lacking oligosaccharide binding sites. The oligosaccharide binding sites are removed in order to reduce the efficacy of the conditions sites are removed in order to reduce the efficacy of the conditions of the conditions of the conditions of the sites of the discontinuous of conditions of the hormone analogue is useful for generating antibodies specifically commone analogue is useful for generating antibodies specifically commone analogue is useful for generating antibodies specifically commone analogue is useful for generating to the resolution to the represent of infertility, as an aid for in civiv fertilisation techniques, and in other therspeutic methods associated with the native hormone. The single chain procein is further useful as a reagent in a manner similar to the heterodimer as a useful singular the process of antibodies with respect to the native proteins in the bological samples, as control reagent in assay this proteins in the bological samples, as a control reagent in assay of the should make the native hormones blud. In detecting and purityly receptors to which the native hormones blud. In detecting and purityly receptors to which the native hormones blud. Con assessing the levels of these objects in the provide an alternate following advancages over their inferior forms: they are more stable, conclinant production are reduced since only a single gene is needed to transcribe, translate and process, they provide an alternate forms which permitting fine tuning of scritily levels and of In vivo half lives. Single chain forms are unique starting materials for identifying the cuming sequence of the subunits permitty of the dimer. The linkage between the subunits permitts the protein to be engineered without disturbing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; single chain gonadotropin analog; anti-infertility; drug; peptide therapy; luteinising hormone; LH; follicle stimulating hormone; ESH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; infertility.
                                                                                                                                                                                                                                                                             New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is an analogue of mature hCG beta subunit having residue 40 replaced by a histidine residue. This introduces an additional cleavage site for CNBr, useful for determining the distiphide bonds. This can be used to show that mutagenesis has not altered the "normal" distiphide pattern of analogues, and for see AARISO43, AARISO61-RISI2S and AARIS161-RISI99.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                         Glycoprotein hormone; human chorlonic gonadotropin; disulphide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ouery Match 99.2%; Score 763; DB 12; Length 145; Best Local Similarity 99.3%; Pred: No. 7.6e-62; Marches 199; Conservative 0; Mismatches 1; Indels (

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human single chain forms of the glycoprotein character which is an agoils to antagonist of intensising hormone ([M]), follocie stimulating hormone ([M]), and the stimulating hormone ([M]), and the stimulating hormone ([M]), and the stimulating hormone is the stimulating hormone set used in tractal in the introverse and other therapeutic methods so associated with the native hormones are useful as reagents in a manner similar to heterodimers, as diagnostic tools to detect the presence of antibodies with respect to the native proteins in both the same of antibodies with respect to the native proteins to both occited an amplies, as control respects to which the native hormones blind the single chain hormones are also used in affinity chromatographic preparation of receptors or antibodies. They are used as purification tools for antibodies they are used as purification tools for antibodies are also used in affinity chromatographic preparations of these materials and to monitor levels of subsequent preparations of these materials and to monitor levels of subsequence is human single chain normones and the subsequence is human single chain open compounds, as substitutes for the heterodimeric forms of beta-subunit coding region law of living serves as substitutely fusion protein and so analogy is 10.10 a. The analogys areves as useful starting compounds for analogy areves as useful starting compounds for sequence. The humans in the hormones of hormones are subunit to define region as an analogy as useful starting compounds for sequence the humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is an analogue of mature hCG beta subunit having residue 37 replaced by a methonina residue. This introduces an additional cleavage site for CMBC, useful for determining the disulphide bonds. This cam be used to show that muragenesis has mot altered the 'normal' disulphide pattern of analogues, and for see AMR15043. AMR19061-R15128 and AAR15161-R15198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
Glycoprotein hormone; human chorionic gonadotropin; disulphide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Owery Match

NAME OF STREET O

```
The invention relates to the production of analogues of a heterodimeric should give joint and mobility of gonadotropin (GPH) and intentially homen (GPH) as 9, human inchiolate gonadotropin (hCG), human lutefallaing hormone (hEH), human follicle stimulating hormone (hEH), human future and the stimulating more of the contain an intersubunit disupphide bond, between an alpha-subunit cysteine and a beta subunit cysteine and a beta subunit opsteine, for contain an intersubunit disupphide bond, between an alpha-subunit cysteine and a beta subunit cysteine for contain an intersubunit disupphide bond, contained the subunit used to be portion of the bioportivity for the corresponding native GPH receptor. This sequence contained a mutated hGC-beta subunit used for the generation of the contained analogues are designed specifically to contain the formed analogues are designed specifically to the creduce perturbation of the 3-dimensional structure of the hormone contained dimer vill have affinity for the native receptors and have asset as for the native GPHs and prolong the hollogical activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human depriosic goradotropin; human luterinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     As The invention relates to the production of analogues of a heterodimeric subunit giycoportein hormone (GPH) = 9. human chorionic gondocropin (hCG), human inteinishing hormone (HER), human inteinishing hormone (HER), human chicles stimulating hormone (HER), human thyrotod stimulating hormone (HER), and functional muteins, which are modified to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit gysteine, for the corresponding artice GPH receptor. This sequence bloadtivity for the corresponding artice GPH receptor. This sequence corresponds a matched hord-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to corresponding article GPH receptor. This sequence ceduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the diener will be formed in vivo and the formed dimer vill have affinity for the native receptors and have segment and prological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hPSH; hTSH; human dioritolic gonadotrophi, human luteinising hormone; dissiphide bond; human follicle stimulating hormone; human ityroid stimulating hormone; stability; primer; amplification; PCR; mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps

The invention relates to the production of analogues of a heterodimeric subunit giyosoprotein hormone (GPB) = 9. Numan chorionic gonadotropin (CC (NCO), human luteinishing hormone (HER), human follicle stimulating hormone (HER), human follicle stimulating hormone (HER), human follicle stimulating hormone (HER), human functional cauteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the contact and part of the machine of the contact and the contact dimensional structure of the hormone, the shologistic activity on them. The changes stabilise the GPHs and prolong as for the native GPHS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTCCGGPRDHPLTCDDPRFQDSSS 140

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    õ
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the production of analogues of a heterodimeric subunit giycoporcein hormone (GRB) a-9, human chorionic gondoctropin cubulut giycoporcein hormone (GRB), and man inteinialing hormone (HRB), human fullicia stimulating hormone (HRB), human inteinialing hormone (HRB), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha subunit cysteine and a beta subunit cysteine, for between an alpha subunit cysteine and a beta subunit cysteine, for the corresponding at least a portion of the hormonic particular of the corresponding native GPH receptor. This sequence the presents a matant hGC beta subunit used for the generation of the creptor and the formation of the Juliana special structure of the hormonic to reduce perturbation of the Juliana should alter will be formed in vivo and the formed dumer will have affinity for the native receptors and have special activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hYSH; human chorionic gomadotroplir; human luteinisling hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone;

Analogue la (human CG-beta(1-145)-linker-human CG-alpha(1-92)[N530, N780]) is a specific example of a single chain gondotrophn having ar chorionic gondotropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids. The analogue la was derived from qanalogue lay removing the two 91ycosylation sites from the alpha-subunit. The analogue has anti-luteinising hormone (lutropin) activity and can be used for facilitating ovulation, terminating pregnancy and reducing androgen secretion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Analogue I (human CG-beta(1-145)-linker-human CG-alpha(1-92)) is a specific example of a single chain gondourcpub naving a chorionic gonaddurcopin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids. The analogue has lutelisizing hormone (lutropin) activity and is useful for inducing ovulation and increasing male fertility.

The sequence is an analogue of mature hCG beta subunit having residues 95 and 97 replaced by the corresponding residues in the bovine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antsee ARRISO43, AARISO61-R15125 and AARISO61-R15198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2 SKEPLRPRCRPINATLAVEKEGCPVCITVNITICAGYCPTMTRVLOGVLPALPQVVCNYR 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is an analogue of mature hGG beta subunit having residues 199-144 replaced by histidine residues. This introduces additional cleavage sites for GNE, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "ormal" disulphide pattern of analogues, and for See AMRISO41, AMRISO61-RISI25 and AMRISO61-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New glyco-protein hormone analogues - for inducing fertility as
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.

The present sequence is the human chorionic gonadotrophin beta cabbair to cabbay reteminal loop mutant ArgisGiu, which can be used in the preparation of a contragestative medicament. The modified beta-hCG has reduced cross reactivity with literinishing hormone (LH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCG can pecific immunosary and for applications where hCG is active, e.g. specific immunosary and for applications where hCG is active, e.g. cappair acrown inhibition. The modified beta-hCG can produce neutralising antibodies to beta-hCG, which do not cross-react with coher neutral hormones.

M.B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified beta-human chorlonic gonadotrophin proteins - useful as contragestative vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ouery Match

                                                                                                                               The present sequence is the human chorionic gonadotrophin beta cabbuilt (beta-NGC), anino terminal loop mutnat Val275yr.

Combined to the preparation of a contragestative medicament: The modified beta-hCG has reduced cross-reactivity with luteinising hornone (LH), as defined by the ability of both luteinising hornone (LH), as defined by the ability of both be used as a contraceptive in females, in a vaccine. In a hGC can specific immunoassay and for applications where hGC is active, e.g. contracting antibodies to beta-hGC which do not cross-react with other natural hormones.

N.B. Sequence not given in the specification, but constructed using the wild type beta-hGG sequence given in nature 307 959460, 37-40 (1984).

The subtitution introduces an additional cleavage site for CMBr, useful for determining the disulphide bonds. This can be used to show that murisquesis has not altered the 'normal' disulphide pattern of analoques, and for examining protein folding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the human chorinonic gonadorrophin beta subunit (beta-hCG), carboxy-terminal loop mutant Argiiser, withor can be used in the preparation of a contragestative, medicament. The modified beta-hCG has reduced cross reactivity with luceinising hormone (Ligh, as defined by the shillty of both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; chorionic gonadotrophin; chorionic gonadotropin; beta-hCG; beta-bunit; amino-terminal loop; mutant; reduction; LH; vaccine; contragestative medicament; cross-reactivity; luteinising hormone; contraceptive; immunossay; Kaposi sarcoma; inhibition; neutralising antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glycoprotein hormone; human chorionic gonadotropin; disulphide.
                                                                                                                                                                        The sequence is an analogue of mature hCG beta subunit having residues 77, 82, and 83 replaced by the corresponding residues in the human LH protein. The chimaric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female and imale. See AMRISO43, AMRISO61-RIS125 and AMRISO61-RIS198.
New glyco-protein hormone analogues - for inducing fertility :
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Owery Match 97.3%; Score 756; DB 12; Length 145; Bet Local Similarity 97.9%; Pred.     subunit (beta-hCG), carboxy-terminal loop mutant val79His, which can be used in the preparation of a contragestation the medicament. The modified beta-hCG has reduced cross-reactivity with lutefanishing hormone (LB), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCG can proteins to react with the same antibody. The modified beta-hCG can specific immunoassay and for applications where hCG is active, e.g. Raposi sarcoma inhibition. The modified beta-hCG can produce neutralising antibodies to beta-hCG, which do not cross-react with coher natural hormones.

W. B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Location/Qualifiers

proteins to react with the same antibody. The modified beta-hGG can be used as a contraceptive in females, in a vaccine, in a hGG specific immunoassay and for applications where hGG is active, e.g. Raposi sarcoma inhibition. The modified beta-hGG can produce neutralising antibodes to beta-hGG, which do not cross-react with other natural hormones.

N.B. Sequence not given in the specification, but constructed using the wild type beta-hGG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; chorlonic gonadotrophin; chorlonic gonadotropin; beta-hCG; beta subunit; amino-terminal loop; mutant; reduction; LH; vaccine; contragestative medicament; cross-reactivity; luteinising hormone; contraceptive; immunoassay; kaposi sarcoma; inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the human chorionic gonadotrophin beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 97.3%; Score 756; DB 18; Length 145; Best Local Similarity 96.6%; Pred. The sequence is an analogue of mature hCG beta subunit having residues 55, 56, and 58 replaced by the corresponding stations in the hFSH protein. It was propd: by site directed mutagenesis of a CDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and famels and may halfsofi-reliate animals (see AAR15041, AAR15061-R15125 and
                                           New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Ten specific analogues were synthesised, acenhor (which was expected to contain 4 Aan-linked oligosaccharides. Removal of the glycosylation sites, particularly from the alpha-subunit, has been shown to reduce hormone efficacy and inhibit signal transduction. The present sequence 1s that of the hCG beta-subunit from which none of the two native glycosylation sites has been removed using strand overlap PCR.
                                                                                                                                                                                                Methods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ouery Match

subunit (beta-hCG), carboxy-terminal loop mutant Gly75H1s, which can be used in the preparation of a contragastative medicament. The modified beta-hCG has reduced cross-reactivity with treinising bermone (HH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCG can be used as a contraceptive in females, in a vaccine, in a hCC cs pecific immunoassay and for applications where hCG is active, e.g. Kaposi sarcoma inhibition. The modified beta-hCG can produce cc neutral hormones.

CC NH. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                          The sequence is an analogue of mature hCG beta subunit having residues 94.96 replaced by the corresponding residues in the equine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antagonist. See ARRISO61.RISI25 and ARRISO61.RISI99.

The invention relates to the production of analogues of a heterodimeric subunit giycoprotein hormone (GPB), when obtoined gonadetropin (CC (hCG), human lutefalsing hormone (HEM), human follicle stimulating bormone (HEM), human follicle stimulating hormone (HEM), human follicle stimulating hormone (HEM), human interial propertion of the content an intersubunit disupplied bond, between an alpha-subunit cysteine and a beta-subunit cysteine, which are modified to contain an intersubunit disupplied bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for content and intersubunit disupplied bond, contrained a material for the content of the subunit used for the generation of the content of the subunit used for the generation of the content of the hormone, thereby creating greater likelihood that the diamer will be formed in vivo and the formed dimer will have affinity for the native receptors and have a storical activity on them. The changes stabilise the GPHs and prolong the storic heartive GPHs and prolong as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human edverionic gonadotropin; human luterinising hormone; disulphide bond; human follicle stimulating hormone; human ithyroid stimulating hormone; stability; primer; amplification; PCR; mutation
                                                                 The present sequence is the human chorionic gonadotrophin beta cashunic commission mutant Proteities.

Which can be used in the preparation of a contragestative medicament. The modified beta-hich has reduced cross reactivity with luteinising hormone (LH), as defined by the ability of both proteinising hormone (LH), as defined by the ability of both be used as a contraceptive in females, in a vaccine, in a hormone perfect immunoassay and for applications where hof can produce to perfect immunoassay and for applications where hoff is active, e.g. Kaposi sarcoma inthibition. The modified beta-hof can produce to meuralising antibodies to beta-hoff, which do not cross-react with other moural hormones.

N. B. Sequence not given in the specification, but constructed using the wild type beta-hoff sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPRDHPLTCDDPRFQASSS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is an analogue of mature hCG beta subunit having residues 89, 91, 92 and 99 replaced by the corresponding residues in the human LM protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals.

                                                    The sequence is an analogue of mature hCG beta subunit having residues 112-115 replaced by the corresponding residues in the equine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist see AAR15043, AAR15061-R15125 and AAR15161-R15198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is an analogue of mature hCG beta subunit having residues 94-97 replaced by the corresponding residues in the hESH protein. It was prepd. by site directed mutagenesis of a cown sequence encoding the hCG beta subunit. The chimeric character is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New qlyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glycoprotein hormone; fertility; immuno-castration;

This sequence represents a fusion protein of the human chorionic congradorrophin (HCG) beta subunit and Jun. The invention relates to a certain of comming a cysteine knot protein (I) having alpha and certain comprising attaching a dimerisation domain (DD) to either the reasonius comprising attaching a dimerisation domain (DD) to either the N-termini of both subunits or the N-terminus of the alpha-subunit and certain of the alpha-subunit and certain of the alpha-subunit and certain of the network of the alpha-subunit and certain of the alpha-subunit and certain and certain and certain of the alpha-subunit and certain of the alpha-subunit and certain of the alpha-subunit and certain of the polycystic ovariand disease (AII). The method is used to produce the recein DD in a see also useful of the polycystic ovariand disease (associated with excessive levels of certain signification of antiques (since a DD may containing highly antiques and callows the formation of heterodimers, that have similar structures can allows the combined on the enditied without loss of activity, and attachment of the DD celuces of a glycoprocial portion of polycystic or at all. The N-terminal part of a glycoprocial portion and conditied without loss of activity, and attachment of the DD reduces the complement of DD reduces of activity, and attachment of the DD reduces of activity, and attachment of DD reduces of activity of DD reduces of ac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; autigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a fusion protein of the human chorionic grandsdropplin (HCG) beta subunit and Jun. The invention relates to a grandscropplin (HCG) beta subunit and Jun. The invention relates to a center of comprising attaching a dimerisation domain (DD) to either the N-termin of beta subunits or the N-terminus of the alpha-subunit and the ferrodiment of beta subunits or the N-terminus of the alpha-subunit and the products to candagous (agoinsts or antagonists) of deglycosylated glycoprobein of propicy and alpha-subunit and second and alpha-subunit and second and the necessity of the second and subunities that would other-stee combine of poorly, or not at all. The N-terminal part of a glycoprotein hormone may be condited without loss of ectivity, and attachment of the D reduces (cormation of homodimers Hare longer circulation times in convex.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins

The modified beta-hCG has reduced cross-reactivity with luteinismen The modified beta-hCG has reduced cross-reactivity with proteins to react with the same antibody. The modified beta-hCG can be used as contraceptive in females, in a vaccine, in a hose used specific immunoassay and for applications where hCG is active, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; chorionic gonadotrophin; chorionic gonadotropin; beta-hCG; beta subunit; amino-terminal loop; mutant; reduction; LH; vaccine; contragestative medicament; cross-reactivity; luteinising hormone; neutralising antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified beta-human chorionic gonadotrophin proteins - useful as contragestative vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chorionic gonadotrophin beta subunit amino-terminal loop mutant.

C argulant (beta-hCG), carboxy-terminal loop mitant of 19/1Mrg.

C argulant (beta-hCG), carboxy-terminal loop mitant of 19/1Mrg.

C argulant (beta-hCG), as defined by the ability of both lutelainsing hormone (iH), as defined by the ability of both both lutelainsing hormone (iH), as defined by the ability of both both loop proteins to react with the same antibody, the modified beta-hCG can specific immunoassay and for applications where hCG is active, e.g. Kaposi sarcoma inhibition. The modified beta-hCG can produce constraints and hormones.

C Raposi sarcoma inhibition. The modified beta-hCG can produce chear natural hormones.

C NB sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                  maman: chorionic gonadorrophin; chorionic gonadorropin; beta-NGG; beta subunit; amino-terminal loop; mutant; reduction; LH; vaccine; contragastative medicament; cross-reactivity; lutefinishing hormone contraceptive; mamnoassay; kaposi sarcoma; inhibition; enettalishing antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified beta-human chorionic gonadotrophin proteins - useful as contragestative vaccine

```
and allows the combination of subunits that would otherwise combine poorly, or not at all. The Wrettrainal part of a glycoprotein hormone may be modified without loss of activity, and attachment of the DD reduces formation of homodimers: Reterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     68 LRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYRDVRF 127

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is an analogue of mature hCG beta subunit having residues 2, 8, 10, and 15 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals. See Analod3, ANISOG3, A

The invention relates to a condition (hCG) alpha subunit and Fos. The invention relates to a condition of systems when the protein (1) having alpha and between comprising attaching a dimerisation domain (DD) to either the N-termini of both subunits or the N-terminis of the alpha-subunit and the remain of the citems of the beta-subunit and dimerising the products to form to the C-terminus of the beta-subunit and dimerising the products to form a heterodiment protein analog (II). The method is used to produce analogues (sponsible and products) to the condition of the products to the retain DD are also useful as a luterially useful.

The polycytic ovariand disease (associated with excessive levels of luterialsing promone). Products that retain DD a zer also useful as a manuogens or antigens (aince a DD may containing highly antigenic anno acid sequences). Attachment of a DD (which may be removed later).

The condition of the production of the production of acid sequences are contained and immunogenic properties) to native dimers,
                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorlonic gonadotrophin; alpha subunit; herapy; Pos.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is an analogue of mature hCG beta subunit having residues 86, 87, 89, 91 and 92 replaced by the corresponding residues 86, 87, 89, 91 and 92 replaced by the corresponding receives in the hFSH protein. It was prepd. by site directed mutagenesis of a CDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. Kaposi sarcoma inhibition. The modified beta-hCG can produce neutralising antibodies to beta-hCG, which do not cross-react with orber natural hormones.

N.B. Sequence not given in the specification but constructed using the wild type beta-hCG sequence given in nature 307 959466, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is an analogue of mature hCG beta subunit having residues 47, 47, 51 and 58 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals. See. ARMISO43, ARMISO43, ARMISO41-RIS125 and ARMISTO41-RIS199.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is an analogue of mature hCG beta subunit having residue life replaced by a Cys residue. This introduces an additional cleaves This for CNBr, useful for determining the disulphile bonds. This can be used to show that mutagenesis has not altered the "normal" disulphile pattern of analogues, and for see Ammining protein folding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                           Glycoprotein hormone; human chorionic gonadotropin; disulphide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is an analogue of mature hCG beta subunit having residues 74, 77, 79, 82 and 83 replaced by the corresponding residues in the bowine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human recoptor and may also have applications as an immunogen, see AMRISO43, AARISO61-RIS125 and AARISO61-RIS198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ouery Match 96.0; Scord 746; DB 12; Length 145; Best Local Similarity 96.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a fragment of the beta subunit of human chorionic gonddotropin (EGG). It is given in a specification relating to a vaccine composition capable of eliciting antibody formation against HoG. The vaccine comprises an HCG polypeptide coupled to diphiberia toxoid or tetanus toxoid and a vehicle comprising a mixture of mannide monocleate with squalane or squalene. The vaccine is useful for contraception, abortion or treatment of hormone related disease states and disorders and the treatment of hormone-associated carcinomas.

                                                                                                                                                                                                                                                  The present sequence is the human chorionic gonadotrophin beta subunit (beta-hCG), amino-terminal loop mutant Lya20Ana, GiuJJArg, Gily22Clu, which can be used in the preparation of a contragestative medicament. The modified beta-hCG has reduced cross-reactivity with luterinising hormone (tall, as defined by the ability of both proteins to react with the same antibody. The modified beta-hCG can be used as a contraceptive in females, in a vaccine, in a hCG specific immunosasy and for applications where hCG is active, e.g. Raposi sarcoma inhibition. The modified beta-hCG can produce noternalising antibodies to beta-hCG, which do not cross-react with other natural hormones.

N. B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 95960, 37-40
                                                                                                                                                          Modified beta-human chorionic gonadotrophin proteins · useful as contragestative vaccine

The sequence is that of a modified form of human chorionic gonadotrophin (hCG), analogue "D', in which amino acids in the "O's addyor "G' regions have been subtituted resulting in changes in the binding specificity and avidity of luteinising hormone (LH) and follicle stimulating hormone (ER) receptor. It is was used to the prepin of an alpha, beta-heterodimentic polypeptide having an affinity to vertebrate LH and FRH:LH acceptors. Such an analogue can be prepared having a desired ratio of FRH:LH activity. The polypeptide may be used for treating human infertility or polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 SKEPLRPRCRPINATLAVEKEGCPVCITVNITICAGYCPTMTRVLQGVLPALPQVVCNYR 60

The invention relates to human single chain forms of the glycoprotein chromograph which is an agonist or antegorist of luterinising hormone component of chromograph which is an agonist or antegorist of intendinish phormone (IM), follicle stimulating hormone (IM), follicle stimulating beta subunits. The agonist forms of single chain hormones are used in treating infertility, as aids in vitro fertilisation techniques, and other therapeutic methods in vitro fertilisation techniques, and other therapeutic methods in vitro fertilisation techniques, and other therapeutic methods of exception in an anner similar to heterodimers as alganostic tools to blooping samples, as control research in a simple chain promone at the presence of antibodies with respect to the native proteins in cleect the presence of antibodies in a vitrol research of receptors or receptors to which the native hormones bind: the single chain normones attained as purification to subsequent preparations of these materials and monitor clevels of subsequent preparations of these materials and continuous administered as a furga. The single chain supported the present sequence is human single chain gonadotropin analog consisting of human chottonic gonadotropin (CG) beta subunit (1-145 amino consisting of human single chain gonadotropin apparation acids) by a linker sequence. This analog serves as a useful starting compound for template directed vaccine design and for the development of
                                                                                                                                                                                                                                                                                          /note- Linker peptide / /note- Linker peptide / /note- Corresponds to 1-92 amino acids of human single chain genadotropin alpha-subunit*
                                                                    /note- "Wild type Asn substituted with Xaa, Where Xaa refers to Gin or other amino acid"
/note= "Wild type Asn substituted with Xaa, Where Xaa
refers to Gln or other amino acid*

                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence is an example of a glycoprotein hormone beta-chain

C analogous used to construct an alpha, beta-heterodimer polypeptide

With altered binding affinity to LH receptor and FSH receptor. The

C heterodimer preferably contains an HGG alpha-subunit and a chimaeric

Deta-subunit containing HGG, LH, FSH and/or thyrotropin residues.

C Binding activity and specificity may be altered without disrupting

C heterodimer formerlion or reaction with antibodies. The D-region of

CHG is most important for LH receptor binding, and the G-region is

C mapt important for FSH binding. Analogue D, with an FSH D-region,

C minds to an in receptor with considerably lower potency than HGG,

C and does not bind to LH receptors. A cDAM for malogue-D may be

Expressed in a CGS-7 cell culture. This type of hormone analogue

C may be useful clinically for induction of evulation in women with

C polycystic ovary disease, or to increase spermatogenesis in

Exceptor and LH and LH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; single chain gonadotropin analog no:1b; anti-infertility; drug; peptide therapy; lutefaliaing hormone; Lif follicle stimulating hormone; FSH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; infertility; fusion protein; mutean; muten.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPIMTRVLQGVLPALPQVVCNYR 61

hormone-specific vaccines for use in humans.

Note: The present sequence is not shown in the specification, but is derived from the human single chain gonadotropin analog no:1 shown as SEQ ID NO: 3, in figure 5 of the specification (AAEO4474).
                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                              The sequence is an analogue of mature hCG beta subunit having residues 39, 41, 42 and 41 steplaced by the corresponding residues 19, 41, 42 and 41 steplaced by the corresponding mutagenesis of a CDNA sequence encoding the hCG beta subunit. The Cimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
three or more peptide monomers which may be used as an famonocontraceptive and/or aboriticatent. The peptide andonomers are faminan chorionic peptides derived from the C-terminal portion of the human chorionic genedictopin beta subunit (HGC-beta) comprising either residues 105-145 cc of HCC beta (AAV87501) or residues 111-145 of HCC-beta (AAV876480). By the peptide monomers are non-immonogenic; bawever, the homopolymer is capable of inducing anti-HCC antibody production HCC plays a role in the maintenance of pregnancy, and has also been shown to induce ovulation and stimulate corpus intend function. Anti-HCC antibodies are aissed against the homopolymer of the invention are not cross reactive with lutenisish phonomo (HJ). The first 10 residues of HCC-beta are virtually identical to those of LH, and prior art anti-HCC antibodies are thought to cause early abortion by neutralising CG in the periance are thought to cause early abortion by neutralising CG in the periance and disrupted almost immediately after to the corpus impaint to cause early abortion parent and capable for control of female fertility. The present sequence represents the beta exemplification of the present length of the assumer exercents the beta exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGS, hyman; chorlonic gonadotrophin; beta subunit; therapy; Jun.

                                                                                                                                                         A movel fusion protein comprises 2 dimer forming co-expressed anino acid sequences, each consisting of a homodiment or heterodiment creceptor child or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a subunit of a heterodiment control hormone capable of forming a heterodimer with heterodiment protein hormone capable of forming a heterodimer with the hormone so ther subunits. The fusion protein, e.g. the thromospotein (FPO)/human chorionic genadotrophin-beta subunit (hoc-beta) fusion protein denoted by the present sequence, significantly increases the biological activity of the hormone component, reducing the requirement for hormone liself and the
                            Hybrid dimeric protein comprising two co-expressed units - each based on receptor or ligand and a subunit of a heterodimeric hormone, especially FSH, for inducing follicular maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Glycoprotein hormone; immuno-castration;
immuno-contragestive, vaccine; human chorionic gonadotropin;

                                                                                                                                                                                                                                                                                               A movel fusion protein comprises 2 dimer forming co-expressed amino acid sequences, each consisting of a homodiment or heterodimeric receptor child or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a subunit of a heterodimeric protein hormone capable of forming a heterodimer with the hormone 3 other subunits. The fusion protein, e.g. the thromone openion of protein, e.g. the thromone openion of protein denoted by the present sequence, significantly increases the biological activity of the hormone component, reducing the requirement for hormone treatled and the

It was prept. by site directed mutagenesis of a coNk sequence encoding the hCC beta subunit. The chimeric hormone is capable of directing hormone binding to both Lift and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animais. (see ANR1504, ANR15061-R15125 and
                                                             the sequence is an analogue of mature hGG beta submit having residues 3.3.8 in 0.118, and 22 replaced by the corresponding residues In the bovine LH protein. The chimeric hormone may be useful for identifying residues within are important for binding to the human zeepoor and may also have applications as an immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New glyco-protein hormone analogues - for inducing fertility of immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

It was prepd. by site directed mutagenesis of a cDMA sequence encoding the hCG beta subunit. The Chimeric hormone is capable of directing hormone blanding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AARISO41-RIS125 and AARIS051-RIS125 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; chorionic gonadotrophin; chorionic gonadotropin; beta-hCG;

The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism.

0; Gaps

```
The sequence is an analogue of mature hCG beta subunit having residues 77, 82, 83, 89, 91, 72 and 99 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in mane and female animals.

Argégélus, Gigy-Siles, Val79His, which can be used in the preparation of a contragestative medicament. The modified beta-hoch sar reduced cross-reactivity with luteinish promone (HH), as defined by the bablisty of both proteins to react with the same antibody. The modified beta-hoc can be used as a contraceptive in females, in a modified beta-hoc can produce mentralism and for applications where hoc is active, e.g. Kaposi sarroma inhibition. The modified hot hock can produce mentralism antibodies to beta-hoc surface with other natural homones.

M. B. Sequence not given in the specification, but constructed using the wild type beta-hoc sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

Liker-human CG-alpha(1-92)[N5X,N18K]) is an example of a chimeric glycopeptide hormone having an extra glycosylation site. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to prevent unwanted antibody or receptor interactions. The present analogue has anti-luteinising hormone (lutropin) activity and can be used for facilitating owulation, terminating pregnancy and reducing androgen secretion.
                                                                                                                                                                                                                                                                                                            99

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single chain gonadotropin analogue 1b with extra glycosylation site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is an analogue of mature hCG beta subunit having residues 40, 42, 45-48, 52, and 55 replaced by the corresponding residues in the equine LH protein. The chimeric hormone may be useful for identifying residues which are importent for binding to the human receptor and may also have applications as an immunogen, see AARISO43, AARISO61-RISI25 and AARISO61-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single chain gonadotropin; human chorionic gonadotropin; hCG;
